PURPOSE: To store and display schedule data by allowing schedule data corresponding to a specified day of the week to be set and specifying the specific day of the wheel in an optional month by a day-of-the-week specifying means, and writing and reading the corresponding schedule data.

CONSTITUTION: When a daily schedule is written, a data input mode is entered with an 'I/O' key 22. Then, the schedule is inputted and an 'SCHE' key 17 is operated to store display data in a data memory part 32 as the daily schedule. In this state, when characters 'WE' indicating, for example, Wednesday is pressed on a tablet input part 12, an analog voltage signal corresponding to the depression position is sent from the tablet input part 12 to an A/D conversion part 37 and converted into a digital value, which is outputted to a CPU31. The CPU31 processes this tablet input as specified. Then a display generation part 35 generates display data according to a fixed format and writes the data in a display buffer 36.
